The relationship between pelvic vein incompetence (PVI) and chronic pelvic pain (CPP) in women: systematic reviews of diagnosis and treatment effectiveness
The data supporting the diagnosis and treatment of Pelvic congestion syndrome (PCS) are limited and of variable methodological quality. There is some evidence to tentatively support a causative association, but it cannot be categorically stated that PVI is the cause of CPP in women with no other pathology, as the six most pertinent studies drew on clinically disparate populations and defined PVI inconsistently. Embolisation appears to provide symptomatic relief in the majority of women and is safe. However, the majority of included studies of embolism were relatively small case series and the only randomised controlled trial was considered at risk of potential biases.

Clinical effectiveness and patient perspectives of different treatment strategies for tics in children and adolescents with Tourette syndrome (TS): a systematic review and qualitative analysis
Antipsychotics, noradrenergic agents and Habit reversal training (HRT)/comprehensive behavioural intervention for tics (CBIT) are effective in reducing tics in children and young people with TS. The balance of benefits and harms favours the most commonly used medications: risperidone, clonidine and aripiprazole.

Non-pharmacological treatments for stuttering in children and adults: a systematic review and evaluation of clinical effectiveness, and exploration of barriers to successful outcomes
Although much of the evidence we identified was from studies at risk of bias, it is suggested that most available interventions for stuttering may be of benefit to at least some people who stutter. There is a requirement for greater clarity regarding what the core outcomes following stuttering intervention should be and also enhanced understanding of the process whereby interventions effect change.

Comment on: NICE STA 381: Olaparib for maintenance treatment of relapsed, platinum-sensitive, BRCA mutation-positive ovarian, fallopian tube and peritoneal cancer after response to second-line or subsequent platinum-based chemotherapy
Olaparib (Lynparza) is not recommended for use within NHS Scotland as monotherapy for the maintenance treatment of adult patients with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy. There is a material difference between the recommendations of the NICE STA and SMC.

NHS EVIDENCE: PUBLIC HEALTH EVIDENCE AWARENESS BULLETIN

Parent-only interventions for childhood overweight or obesity in children aged 5 to 11 years
This systematic review looks at the efficacy of diet, physical activity and behavioural interventions delivered to parents only for the treatment of overweight and obesity in children aged 5 to 11 years.
Cochrane Database of Systematic Reviews

Easier said than done: why we struggle with healthy behaviours and what to do about it
This report sets out some of the reasons why people might find it hard to live in a healthy way, exercising, eating well, getting adequate sleep, and checking for early warning symptoms. It also looks to the field of behavioural science for strategies that people can use to overcome those hurdles and to initiate lifestyle changes.
Royal Society for the encouragement of Arts, Manufactures and Commerce

Implementation conditions for diet and physical activity interventions and policies: an umbrella review
This review examines the evidence-based conditions that are important for successful implementation of interventions and policies that promote healthy diet, physical activity, and a reduction in sedentary behaviors.
BMC Public Health 2015 15:1250

EPPI Centre
Contrast-Induced Nephropathy: Comparative Effects of Different Contrast Media
We found low strength of evidence (SOE) to support no differences in Contrast-Induced Nephropathy (CIN) risk between low-osmolar contrast media (LOCM), and moderate SOE that iso-osmolar contrast media (IOCM) had a slightly lower risk of CIN than LOCM, but the lower risk was not clinically important and had only borderline statistical significance. No relationship was found between comparative CIN risk and route of administration. For clinicians, these findings suggest that the choice between IOCM and LOCMs will not have an important effect on the risk of CIN.

Diagnosis and Management of Infantile Hemangioma
Corticosteroids demonstrate some effectiveness at reducing IH size/volume, but may be associated with significant side effects. Propranolol is effective at reducing the size of IH, with high strength of evidence for effects on reducing lesion size, and compared with placebo, observation, and other treatment methods including steroids in most, but not all, studies. Evidence pointed to substantial side effects for corticosteroids; harms were also noted with beta-blockers, but overall, these were well tolerated in the short term. Laser studies generally found PDL more effective than other types of laser, but effects remain unclear as studies are heterogeneous.

Improving Antibiotic Prescribing for Uncomplicated Acute Respiratory Tract Infections
The best evidence supports the use of specific education interventions for patients/parents and clinicians, procalcitonin testing in adults, and electronic decision support to reduce overall antibiotic prescribing (and in some cases, improve appropriate prescribing) without causing adverse consequences, although the reduction in prescribing varied widely. Additionally, public parent education campaigns had low-strength evidence of reducing overall prescribing, not increasing diagnosis of complications, and decreasing subsequent visits. Other interventions had evidence of improved prescribing, but evidence on adverse consequences was lacking, insufficient, or mixed.

**Telehealth for Patients with Cardiovascular Disease: A Review of the Clinical Effectiveness, Cost-effectiveness and Guidelines**
Telemonitoring of blood pressure costs more than usual care, but it may represent a useful tool for hypertension control by improving blood pressure and increasing the chances for patients to achieve blood pressure normalization. There was no evidence available on the cost-effectiveness of telemonitoring in patients with CAD requiring cardiac rehabilitation, but telehealth interventions do not have inferior outcomes compared to center-based supervised programs, and telephone support may reduce hospitalizations and reduce risk factors for heart disease. For patients with heart diseases requiring implantable cardiac devices, the costs of telemonitoring were lower than conventional hospital monitoring. Pacemaker telemonitoring led to earlier cardiovascular event detection, with a reduction in hospital visits and hospitalizations.

**Daptomycin for Methicillin-Resistant and Methicillin-Sensitive Staphylococcus Aureus Infection: A Review of Clinical Effectiveness, Cost-Effectiveness and Guidelines**
There was no significant difference in clinical outcomes between daptomycin, linezolid and vancomycin for the treatment bacteremia, skin and soft tissue infections (SSTI), and complicated skin and skin structure infections (cSSSI) caused by Staphylococcus aureus including MRSA. There was no significant difference between daptomycin, linezolid and vancomycin with regards to infection related length of stay (IRLOS) in hospital, total length of stay, medical resource utilization, and clinical
response measures such as cure, improvement, no improvement, or failure. Overall, the efficacy of daptomycin for the treatment of bacteremia or other infections caused by MRSA was comparable to other MRSA-active, and MSSA-active antibiotics.

**Gabapentin for HIV-associated Neuropathic Pain: A Review of the Clinical Effectiveness**
There is limited evidence for the use of gabapentin for the treatment of HIV-associated neuropathy. One RCT and one non-randomized study suggested that gabapentin may improve pain and related sleep disturbances caused by HIV-associated sensory neuropathy; however, due to the limitations of the evidence, the effectiveness of gabapentin for patients with HIV-associated neuropathy is inconclusive

**Efinaconazole for Fungal Nail Infections: A Review of the Clinical Effectiveness, Cost-effectiveness, and Guidelines**
Compared to vehicle alone, efinaconazole resulted in greater complete cure or mycological cure rates in adults with mild to moderate onychomycosis. A network meta-analysis showed that for treatment of onychomycosis, oral antifungal agents ranked higher than topical antifungal agents with respect to mycological cure; and among the topical antifungal agents, efinaconazole ranked the highest. A Canadian guideline recommended an oral antifungal agent (terbinafine) for severe disease, oral terbinafine or topical antifungal agent (efinaconazole) for moderate disease and efinaconazole for mild disease.

**Rapid and Ultra-Rapid Detoxification in Adults with Opioid Addiction: A Review of Clinical- and Cost-Effectiveness, Safety, and Guidelines**
There is some evidence suggesting earlier peaking of, and lower scores for, withdrawal symptoms and higher rates of the commencement and continuation of maintenance treatment in patients receiving UROD, compared to patients in control groups (e.g., conventional withdrawal treatment). However, no significant differences were identified between UROD and control groups in the commencement or duration of withdrawal treatment. Mixed results were identified between UROD and control groups in the completion of withdrawal treatment and the incidence of adverse events, depending on what pharmacologic agents were used. One guideline recommended against the use of UROD, due to high risk for adverse events.
Daptomycin for Vancomycin-Resistant Enterococcal Infection: A Review of the Clinical Effectiveness, Cost-Effectiveness and Guidelines
Evidence is inconsistent regarding the comparative effectiveness and safety of daptomycin in patients with VRE infection. In particular, some studies suggest that daptomycin is similar to linezolid or -lactams, while others favour one therapy over another. However, several important limitations exist among these studies, which threaten the validity of the evidence and limit its utility for decision-making.

Treatment of Older Adults with Insomnia, Agitation, or Delirium with Benzodiazepines: Clinical Effectiveness and Guidelines
In older adults, low dose doxepin (up to 6 mg daily) appears to be more effective than placebo for the short-term treatment of insomnia. The short-term incidence of adverse effects with doxepin and placebo appears to be similar; however no conclusions can be drawn due to limitations in the evidence available. No studies or evidence-based guidelines were identified on the use of benzodiazepines or other sedative hypnotics in older adults.

Among chronic kidney disease (CKD) patients with iron deficiency anemia (IDA), oral heme iron polypeptide (HIP) was comparably effective compared with intravenous (IV) iron preparations or oral ferrous sulfate to improve hemoglobin levels and transferrin saturation. However, both IV iron and oral ferrous sulfate improved serum ferritin levels to a significantly higher level than HIP in CKD patients with IDA. Oral ferrous sulfate is similarly effective to either oral iron polymaltose complex (IPC) or iron-zinc combination preparations to improve hemoglobin levels in children with IDA aged between 6 months and 15 years. Oral ferrous sulfate has comparable efficacy as oral IPC for the treatment of IDA during pregnancy.
Trained Health Coaches for Chronic Disease Prevention or Management: A Review of Clinical and Cost-Effectiveness and Guidelines
Despite a considerable amount of relevant literature, heterogeneity between the identified studies meant that no firm conclusions could be made regarding the effectiveness of health coaching. A health coaching intervention for patients following myocardial infarction was not determined to be cost-effective when compared with usual care in one economic analysis.
