NIHR

Barriers to and facilitators of smoking cessation in pregnancy and following childbirth: literature review and qualitative study
Perceptions and experiences of barriers to and facilitators of smoking cessation in pregnancy are fluid and context dependent. Effective interventions for smoking cessation in pregnancy should take account of the interplay between the individual, interpersonal and environmental aspects of women’s lives.

Faecal immunochemical tests to triage patients with lower abdominal symptoms for suspected colorectal cancer referrals in primary care: a systematic review and cost-effectiveness analysis
Faecal immunochemical testing is likely to be a clinically effective and cost-effective strategy for triaging people who are presenting, in primary care settings, with lower abdominal symptoms and who are at low risk for CRC. Further research is required to confirm the effectiveness of faecal immunochemical testing in primary care practice and to compare the performance of different FIT assays.

Screening strategies for atrial fibrillation: a systematic review and cost-effectiveness analysis
A national screening programme for AF is likely to represent a cost-effective use of resources. Systematic opportunistic screening is more likely to be cost-effective than systematic population screening. Nurse pulse palpation or modified blood pressure monitors would be appropriate screening tests, with confirmation by diagnostic 12-lead electrocardiography interpreted by a trained GP, with referral to a specialist in the case of an unclear diagnosis. Implementation strategies to operationalise uptake of systematic opportunistic screening in primary care should accompany any screening recommendations

Multiplex tests to identify gastrointestinal bacteria, viruses and parasites in people with suspected infectious gastroenteritis: a systematic review and economic analysis
The systematic review and cost-effectiveness model identify uncertainties about the adoption of gastrointestinal pathogen panel (GPP) tests within the NHS. GPP testing will generally correctly identify pathogens identified by conventional testing;
however, these tests also generate considerable additional positive results of uncertain clinical importance.

What carcinoembryonic antigen level should trigger further investigation during colorectal cancer follow-up? A systematic review and secondary analysis of a randomised controlled trial
The results suggest that (1) CEA testing should not be used alone as a triage test; (2) in year 1, testing frequency should be increased; (3) the threshold for investigating a single test result should be raised to 10 µg/l; (4) after the second CEA test, decisions to investigate further should be made on the basis of the trend in CEA levels; (5) the optimal threshold for investigating the CEA trend falls over time; and (6) continuing smokers should not be monitored with CEA testing.

KINGS FUND

Tackling variations in clinical care: Assessing the Getting It Right First Time (GIRFT) programme
Through an informal assessment of the programme, this paper sets out what the programme is, why it is needed, what is different about it, what challenges it faces and what potential it has. It also contains vignettes illustrating hospitals’ experiences of the programme.

Evidence note 68: What is the evidence for the effectiveness and cost-effectiveness of vocational rehabilitation in relation to health outcomes and non-health outcomes for people with inflammatory arthritis?
Vocational rehabilitation is a complex intervention which has several definitions in the literature. Variation across studies limits conclusions around the most effective format, intensity or duration of intervention and prevents identification of those individuals most likely to benefit. Qualitative studies emphasise the need to tailor interventions to the perspectives, needs and goals of individual patients and highlight the importance of symptom management, particularly in relation to fatigue.

Evidence note 69: In patients with suspected rheumatoid arthritis, does the use of musculoskeletal ultrasound increase the ability of rheumatologists to confirm or rule out a diagnosis of rheumatoid arthritis at an earlier stage compared to routine diagnostic assessment?
Evidence from two overlapping systematic reviews indicates that adding musculoskeletal ultrasound imaging to clinical assessment and laboratory testing improves early diagnosis of rheumatoid arthritis. This was supported by other observational studies.

A review of the clinical effectiveness of direct oral anticoagulants for the prevention of stroke and systemic embolism in adult patients with non-valvular atrial fibrillation
No direct comparisons between DOACs were identified therefore this rapid review is based entirely on indirect evidence from published network meta-analyses. The effects of apixaban 5mg, edoxaban 60mg and dabigatran 150mg on stroke and systemic embolism prevention were similar. Rivaroxaban 20mg was less effective than dabigatran 150mg. In analysis of absolute risks, rather than relative risks, the absolute risk of stroke and systemic embolism for NVAF patients treated with a standard dose DOAC was lowest for dabigatran 150mg.

NHS Dumfries and Galloway Case Study: Balancing Capacity with Demand at Dumfries and Galloway Royal Infirmary
A large rise in the number of visitors to the Emergency Department prompted Dumfries and Galloway Royal Infirmary to undertake an urgent review of patient flow. The hospital’s improvement team decided to implement Daily Dynamic Discharge on one ward after being inspired by a workshop at a National Unscheduled Care event. It proved such a success that the model has now been implemented across the hospital and is being rolled out to the community. This is their story.

AHRQ (Agency for Healthcare Research and Quality - USA)

Venous Thromboembolism Prophylaxis in Major Orthopedic Surgery: Systematic Review Update
VTE prophylaxis after major orthopedic surgery (total hip or knee replacement, or hip fracture) trades-off lowered VTE risk with possible adverse events – in particular, for most interventions, major bleeding. There may be selective outcome reporting bias as most studies include asymptomatic and other low-risk DVTs. There is also relatively sparse evidence on interventions other than LMWH.

The need for a complex systems model of evidence for public health
The Health Foundation is working with Dr Harry Rutter from the London School of Hygiene and Tropical Medicine to develop a new model of evidence that will inform
public health research, policy and practice. As part of this work Dr Rutter and co-authors from the Health Foundation and around the world have published a new Viewpoint paper – The need for a complex systems model of evidence for public health – in The Lancet, which outlines the need for new approaches to designing and evaluating population-level interventions to improve health.

**McGill University Health Centre (Canada)**

**Use of Extracorporeal Membrane Oxygenation for Cardiac Life Support in adult subjects**

The objective of this report is to review the evidence on outcomes, efficacy, and safety of veno-arterial ECMO (VA-ECMO). Data on survival rates for VA-ECMO relative to alternative options are inconclusive given the limited evidence base, heterogeneous study populations, and inconsistent results. The current literature has not yet established clear normative guidelines due to the heterogeneous study population and limited body of evidence on clear indicators for survival.
