Certolizumab pegol and secukinumab for treating active psoriatic arthritis following inadequate response to disease-modifying antirheumatic drugs: a systematic review and economic evaluation
Secukinumab and certolizumab pegol may be an effective use of NHS resources, depending on the subpopulation and subgroup of psoriasis severity.

Spot protein–creatinine ratio and spot albumin–creatinine ratio in the assessment of pre-eclampsia: a diagnostic accuracy study with decision-analytic model-based economic evaluation and acceptability analysis
Evidence from this clinical study does not support the recommendation of 24-hour urine sample collection in hypertensive pregnant women. The spot albumin–creatinine ratio test had better diagnostic performance when predicting severe pre-eclampsia.

HEALTH SCOTLAND

Rapid evidence review: The impact of promotions on high fat, sugar and salt (HFSS) food and drink on consumer purchasing and consumption behaviour and the effectiveness of retail environment interventions
The first section looks at the context of obesity and landscape of promotions in Scotland. The second section sets out the evidence on the impact of promotions on purchasing and consumption behaviour and the effectiveness of retail promotional interventions to encourage the purchase of healthy foods. The final section provides conclusions from the available evidence and limitations of the review.

Drugs-related deaths rapid evidence review
This rapid review presents findings of recent highly processed evidence about interventions to keep people safe, and reduce drug-related deaths. The scope of the review was to respond to the specific risks and needs identified for Scotland’s vulnerable ageing cohort of people with a drug problem.

NG77 Cataracts in adults: management
This guideline covers managing cataracts in adults aged 18 and over. It aims to improve care before, during and after cataract surgery by optimising service organisation, referral and surgical management, and reducing complications. It further aims to improve the availability of information for people with cataracts before, during and after cataract surgery.

AHRQ (Agency for Healthcare Research and Quality - USA)

Treatment for Adults With Schizophrenia
Most comparative evidence on pharmacotherapy relates to the older drugs, with clozapine, olanzapine, and risperidone superior on more outcomes than other second-generation antipsychotics (SGA). Older SGAs were similar to haloperidol on benefit outcomes but had fewer adverse event outcomes. Most psychosocial interventions
improved functional outcomes, quality of life, and core illness symptoms, and several reduced relapse compared with usual care.

Canadian Agency for Drugs and Technologies in Health (CADTH)

**Linezolid for the Treatment of Infections: A Review of the Clinical and Cost-Effectiveness**
The evidence suggests that for MRSA bacteremia, MRSA pneumonia, and VRE bacteremia, the clinical outcomes of linezolid in comparison to daptomycin or vancomycin are comparable. For skin and soft tissue infections caused by MRSA, the evidence favoured treatment with linezolid, possibly due to suboptimal dosing of vancomycin. In general, due to variation in study findings and lack of high quality comparative trials, the effectiveness of linezolid over vancomycin or daptomycin for the treatment of MRSA infections and daptomycin for VRE infections remains uncertain.

**Dialectical Behavioral Therapy for Adults with Mental Illness: A Review of Clinical Effectiveness and Guidelines**
Overall, DBT or DBT-based interventions were not statistically significantly better than comparators at reducing depressive and anxiety symptoms, suicidal ideation, or hospitalization. There were no differences between DBT and comparators at improving symptoms of emotional dysregulation, bipolar disorders, mindfulness and awareness, ADHD, or quality of life in adults with mental illness.
Gene Expression Tests for Women with Early Stage Breast Cancer: A Review of Clinical Utility and Cost-Effectiveness
One moderate quality comparative clinical study provided evidence to suggest that Oncotype DX and EndoPredict were both prognostic for the risk of distant recurrence in the years zero through five. In years five through 10 EndoPredict was better able to predict distant recurrence compared to Oncotype DX. One moderate quality comparative cost-effectiveness study determined that the use of Mammostrat was more cost-effective.

Rigid Dressings for Edema Management for Leg Amputation: A Review of Clinical and Cost-Effectiveness
There is low quality evidence that suggests faster recovery (reduction in time duration between amputation and prosthetic fitting or reduction in edema volume) with the use of rigid dressings compared to non-rigid dressings in patients who underwent transtibial amputation.

Short-Term Psychodynamic Psychotherapy for the Treatment of Mental Illness: A Review of Clinical Effectiveness and Guidelines
Good evidence showed that short-term psychodynamic psychotherapy (STPP) could be more effective than control conditions (wait list, treatment as usual) in patients with depression or with common mental disorders, though the difference wasn't sustained. There were no differences between STPP and CBT in adults with major depressive disorder in depression symptoms, quality of life, or adverse events rates.

Tacrolimus for the Treatment of Adults with Psoriasis or Vitiligo: A Review of the Clinical and Cost-Effectiveness
Low quality evidence suggests that tacrolimus demonstrates clinical effectiveness for the treatment of different manifestations of adult psoriasis and adult vitiligo, when compared with pine tar, calcipotriol, pimecrolimus, or mometasone furoate.

Adapted or Tailored Psychological Interventions for Treating Women with Mental Illness: A Review of Clinical Effectiveness and Guidelines
The limited quantity of data on adapted or tailored psychological interventions for women with anxiety disorders, depressive disorders, and substance-related and addictive disorders is insufficient to make conclusions on its impact or comparative efficacy. The findings do suggest that Mom-Net, an Internet-facilitated cognitive behavioural therapy (CBT) program has the potential to reduce prevalence of depressive symptoms relative to Motivational Interview and Referral to Services.

Glasgow Centre for Population Health
The potential impact of sugar taxation on young people’s dietary intake
The research concluded that the prevalence of sugar-related health problems, and the major contribution that consumption of sugar-sweetened beverages (SSB) make to sugar in the diets of Scottish children and young people, builds a strong case for prioritising measures to reduce SSB consumption. Despite some caveats regarding possible substitution effects, the potential of reduced sugar intake for improvements in weight and dental health at a population level is significant and a tax on SSBs should be considered as a part of a wider strategy to address sugar-related health problems in children and young people.
