Screening women aged 65 years or over for abdominal aortic aneurysm: a modelling study and health economic evaluation
A discrete event simulation model was developed to provide a clinically realistic model of screening, surveillance, and elective and emergency AAA repair operations. Input parameters specifically for women were employed. The model was run for 10 million women, with parameter uncertainty addressed by probabilistic and deterministic sensitivity analyses. The accepted criteria for a population-based AAA screening programme in women are not currently met.

Scottish Medicines Consortium

niraparib tosylate monohydrate (Zejula)
niraparib tosylate monohydrate is accepted for restricted use within NHS Scotland, as monotherapy for the maintenance treatment of adult patients with platinum-sensitive relapsed high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy. Zejula is restricted to patients who do not have a germline BRCA mutation.

Social prescribing resources
Social prescribing is an approach used to support self-management. It is primarily used for connecting people to non-medical sources of support or resources within their community. It can also be used by professionals working in other services and enhances the holistic approaches to addressing health, wellbeing and mental health problems. The resources here include a background paper, a guidance paper, written case studies and video case studies.

NICE

NG102 Community pharmacies: promoting health and wellbeing
This guideline covers how community pharmacies can help maintain and improve people’s physical and mental health and wellbeing, including people with a long-term condition. It aims to encourage more people to use community pharmacies by integrating them within existing health and care pathways and ensuring they offer standard services and a consistent approach. It requires a collaborative approach from individual pharmacies and their representatives, local authorities and other commissioners.

TA534 Dupilumab for treating moderate to severe atopic dermatitis
Dupilumab is recommended as an option for treating moderate to severe atopic dermatitis in adults, only if the disease has not responded to at least 1 other systemic therapy, such as ciclosporin, methotrexate, azathioprine and mycophenolate mofetil, or these are contraindicated or not tolerated. Stop dupilumab at 16 weeks if the atopic dermatitis has not responded adequately.

**Self-care for minor ailments**
The broad aim of these three reviews and their overarching synthesis is to explore the factors that may enhance, or limit, the effectiveness of interventions or services designed to promote self-care for minor ailments and to synthesise evaluations of existing interventions/services to estimate their effectiveness. The review findings suggest interventions should be multi-modal; educational interventions on their own are unlikely to be effective. A range of feasible interventions, based on the behavioural analysis, could be implemented and tested for effectiveness in practice. Existing effective behaviour change interventions should continue to be supported, including issuing back-up (delayed) antibiotic prescriptions for minor conditions.

**AHRQ (Agency for Healthcare Research and Quality - USA)**

**Treatment for Bipolar Disorder in Adults: A Systematic Review**
All antipsychotics approved by the FDA, except aripiprazole, had low-strength evidence for benefit for acute mania in adults with bipolar I disorder (BD-I). Lithium improved short-term for acute mania and resulted in longer time to relapse in the long term versus placebo in adults with BD-I. Aside from low-strength evidence showing CBT and systematic/collaborative care having no benefit for a few outcomes, evidence was insufficient for nondrug interventions.

Nonsurgical Treatments for Urinary Incontinence in Women: A Systematic Review Update
Network meta-analyses demonstrated that most nonpharmacological and pharmacological interventions are more likely than no treatment to improve UI outcomes and quality of life. Behavioral therapy, alone or in combination with other interventions, is generally more effective than 2nd line (pharmacological) therapies alone for both stress and urgency UI. Onabotulinum toxin A may be more effective than neuromodulation as third-line therapy for women with urgency UI.

Reducing emergency admissions: unlocking the potential of people to better manage their long-term conditions
This briefing summarises research that explores the link between how well patients feel able to manage their long-term conditions such as asthma, diabetes and depression and their use of health care. The findings show the NHS could reduce avoidable health care use and improve people’s quality of life, if they were better supported to manage their long-term conditions. The briefing points to solutions and calls for national policy makers and the local NHS to take action now, including by prioritising support for self-management in the NHS long-term plan.

Methoxyflurane was effective for pain relief when compared with placebo, and adverse events were primarily mild and transient.
Radioembolization with yttrium-90 Microspheres for the Management of Uveal Melanoma Liver Metastases: A Review of Clinical Effectiveness and Cost-Effectiveness

Limited evidence suggests patients on Selective internal radiation therapy (SIRT) both as first-line therapy or following failed systemic chemotherapy had a statistically significant improvement in median overall survival time compared to those on historical systemic chemotherapy, and this effect was larger in the group of patients who received SIRT as first-line treatment.

Biologics Dose Escalation for the Treatment of Inflammatory Bowel Disease: A Review of Clinical Effectiveness, Cost-Effectiveness, and Guidelines

Limited evidence suggest that higher or more frequent dosing of adalimumab or infliximab had similar clinical effects as standard dosing. Doubling the infliximab dose and shortening the intervals of infliximab infusion were similarly effective to achieve clinical response, compared to switching to adalimumab in the short or long term.

Rituximab for the Treatment of Myasthenia Gravis: A Review of Clinical Effectiveness, Cost-Effectiveness, and Guidelines

Limited evidence suggests that rituximab treatment offers some clinical benefit to adult patients with refractory myasthenia gravis. Quality of life was reported in a few studies and there was suggestion of improvement with rituximab treatment.

Hydrogel Spacer to reduce rectal toxicity in prostate cancer radiotherapy: a health technology assessment
The evidence indicates that the use of SpaceOAR is effective in increasing the distance between the prostate and rectal wall and thus decreasing the amount of radiation received by the rectum during prostate cancer radiotherapy. However, it remains unclear whether the reduction in rectal dose-volume results in reduced rectal toxicity and improved quality of life.
